                                                                                                                                                                                                                                              The ob-receptor (OB-R), a member of the cytokine receptor family is transcribed in the hypothalamus and is involved in obesity. The replacement mutant has had amino acids 420-496 the second CK-F3 module in OB-R deleted and replaced by amino acids 500-632. The replacement mutant together with mutants lacking a functional first module or a functional intracellular domain can be used in assays for detection of ligands, agonists, antagonists and ligand mimetics. The leptin agonists identified can be used in situations where leptin antagonists identified can be used in the treatment of ancrexia and cachexia. The mutant receptor nucleic acids can also be used in gen therapy for weight control, e.g. for treating obesity or anorexia.

                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents the obesity (OB) receptor C protein. This sequence has one or more of the biological properties of naturally occurring OB receptor protein. The OB receptor proteins and OB receptor/OB protein complexes are used for the treatment of obesity, diabetes, high blood lipid levels and high cholesterol levels. The proteins may also be used to treat an individual for weight loss or

                                                                                                                                                                                                                                                                                                                          The present sequence is the human WSX receptor variant 6.4, which can be used to identify and purify ligands and activators. An anti-WSX receptor antibody can be used as an agonist to activate the WSX receptor, leading to enhanced proliferation or differentiation of a cell expressing the WSX receptor. It can also be used to decrease body weight and/or fat-depot weight and/or food intake in an obese mammal. WSX receptor ligands can be used to cenhance proliferation or differentiation of lymphoid, myeloid or erythroid blood cell lineages. This is useful when a mammal, cespecially a human, is suffering from decreased blood cell levels, i.e. anaemia, caused by chemotherapy, radiation therapy or bone marrow transplantation therapy. It can also be used to repopulate blood cells in a mammal. The products can also be used to treat, ce.g. neoplastic disorders, arteriosclerosis, Type II diabetes, polycystic ovarian disease, cardiovascular diseases, insulin resistance, hypercholesterolaemia, hypertriglyceridaemia, cancer and cholelithiasis.
                                                                                                                                                                                                                                                    Query Match 77.2%;

                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is the human WSX receptor variant 12.1, which can be used to identify and purify ligands and activators. An anti-WSX receptor antibody can be used as an agonist to activate the wSX receptor, leading to enhanced proliferation or differentiation of a cell expressing the WSX receptor. It can also be used to decrease body weight and/or fat-depot weight and/or food intake in an obese mammal. WSX receptor ligands can be used to enhance proliferation or differentiation of lymphoid, myeloid or erythroid blood cell lineages. This is useful when a mammal, especially a human, is suffering from decreased blood cell levels, i.e. anaemia, caused by chemotherapy, radiation therapy or bone marrow transplantation therapy. It can also be used to repopulate blood cells in a mammal. The products can also be used to treat, e.g. neoplastic disorders, arteriosclerosis, Type II diabetes, polycystic ovarian disease, cardiovascular diseases, insulin resistance, hypercholesterolaemia, hypertriglyceridaemia, cancer and cholelithiasis
                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                                        This sequence represents the obesity (OB) receptor A protein. This sequence has one or more of the biological properties of naturally occurring OB receptor protein. The OB receptor proteins and OB receptor/OB protein complexes are used for the treatment of obesity, diabetes, high blood lipid levels and high cholesterol levels. The proteins may also be used to treat an individual for weight loss or weight maintenance required for purely cosmetic purposes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    for detecting a defective obese protein or leptin receptor (OB-R) in cells. Them method comprises contacting RNA extracted from a cell population (preferably an ovary, prostate, testis, sperm, ova, ovarian follicular or blood cell population) with an coligonucleotide derived from a portion of the human OB-R variant form 1, 2 or 3 cDNA, and detecting hybridisation. Forms 2 and 3 are associated with infertility, as they are unable to correctly transduce signals from leptin binding. The detection method can be used to diagnose infertility, or predisposition to infertility, while treatments that inhibit or down regulate the variants, gene therapy to replace them in homozygotes or direct activation of downstream signal transduction can be used to improve fertility.

CC Also described is the use of labelled DNA probes based on the OB-R sequence to screen for other variants.

cytoplasmic domain at the C-terminal end. A claimed method for Cytoplasmic domain at the C-terminal end. A claimed method for Cthis for hybridisation to an oligonucleotide (I) derived from the CC CB-R variant gene, especially from the region beyond nucleotide 2770. Also claimed are methods of: (1) treating obesity by CC administration of an agent that inhibits expression of the OB-R cariant gene; and (2) identification of a compound that can CC supplement activity of leptin by: (1) incubating cells expressing CC OB-R variant first with leptin and then with a test compound, and CC (ii) comparing activation signals between cells treated and not treated with the test compound. Inhibition/down-regulation of the variant OB-R (found in obese people) improves response of cells to CC weight regulation by leptin. Replacing variant OB-R by gene therapy CC (in homozygous individuals) can be used to treat obesity. Labelled probes based on the gene can be used to isolate other variant forms of the receptor gene or to detect the variant gene (e.g. for C determining predisposition to obesity), while the OB-R gene can be used to express variant obsective. While the OB-R gene can be used to express of appetite and hypermetabolic activity). Cells cantibodies that competitively inhibit, neutralise or enhance activity of the variant receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Detecting treatment receptor,

splicing of a common precursor mRNA. A claimed method for this for hybridisation to an oligonuclectide (I) derived from the CC OB-R variant gene, especially from the region beyond nucleotide (CC 2770. Also claimed are methods of: (1) treating obesity by CC administration of an agent that inhibits expression of the OB-R cc variant gene; and (2) identification of a compound that can cc supplement activity of leptin by: (i) incubating cells expressing cc OB-R variant first with leptin and then with a test compound, and cc treated with the test compound. Inhibition/down-regulation of the cariant OB-R (found in obese people) improves response of cells to comparing activations signals between cells treated and not created with the test compound. Inhibition/down-regulation of the compound in obese people) improves response of cells to compound that can be used to treated on the gene can be used to treat obesity. Labelled created to express recombinant obesity, while the OB-R gene therapy conducted to express recombinant obesity, while the OB-R gene can be used to isolate other variant forms conducted to express recombinant ober (optionally as fusion protein) and cc in standard hybridisation assays. The OB-R gene can also be used to express variant competition of functional OB-R (causing loss of appetite and hypermetabolic activity). Cells creen for (ant)agonists of leptin/OB-R interaction, also to generate antibodies that competitively inhibit, neutralise or enhance activity.
treatment and screen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (OB-R). Its sequence was deduced from a contiguous cDNA (AAT72649) derived from overlapping clones isolated from a human foetal liver library. The sequence shows near identity to a published OB-R sequence in the extracellular domain, with the exception of 3 amino acids, but there is extensive diversity in the intracellular cytonlasmic domain, at the continuation of the continuation of the cytonlasmic domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 12; Fig 1A-E;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Detecting defective form of leptin I with oligonucleotide derived from treatment of obesity by inhibiting and screening for agents that increases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI; 1997-385291/35.
